DETAILED ACTION

Allowable Subject Matter

1. Claims 1-31 are allowed.
2. The following is an examiner's statement of reasons for allowance:

Claim 1 recites, inter alia, an integrator having an input coupled to said second winding for providing an output representing an amount of magnetic energy storage in said power magnetic element; a comparison circuit for detecting when said output of said integrator indicates that said amount of magnetic energy storage has reached a level substantially equal to zero; a sampling circuit having a signal input coupled to said second winding and a control input coupled to an output of said comparison circuit for sampling a voltage of said second winding in conformity with said integrator indicating that said amount of magnetic energy storage has reached said substantially zero level; and a switch control circuit having an output coupled to said switching circuit and having an input coupled to an output of said sampling circuit, whereby said switching circuit is controlled in conformity with said sampled voltage.

Claim 14 recites, inter alia, a first detection circuit having an input coupled to said second winding for detecting a zero magnetic energy storage cycle point of a post-conduction resonance condition of said power magnetic element; a second detection circuit coupled to an output of said first detection circuit for detecting a beginning of a subsequent post-conduction resonance condition of said power magnetic element in conformity with an output of said first detection circuit that indicates said detected zero magnetic energy storage cycle point; a sampling circuit having a control input coupled to said second detection circuit for sampling a voltage of said second winding at a time preceding or equal to said beginning of said subsequent post-

Art Unit: 2838

conduction resonance condition; and a switch control circuit having an output coupled to said switching circuit and having an input coupled to an output of said sampling circuit, whereby said switching circuit is controlled in conformity with said sampled voltage.

Claim 18 recites, inter alia, integrating a first voltage across said second winding to determine a second voltage corresponding to a level of magnetic energy storage in said power magnetic storage element; comparing said second voltage to a threshold to determine a sampling time at which said level of magnetic energy storage is substantially equal to zero; sampling said first voltage at said sampling time; and controlling subsequent energizing of said magnetic storage element in conformity with said sampled first voltage.

Claim 24 recites, inter alia, first detecting a zero magnetic energy storage cycle point of a post-conduction resonance condition of said power magnetic storage element in conformity with said sensed magnetic flux; second detecting a beginning of a subsequent post-conduction resonance condition of said power magnetic element in conformity with a result of said first detecting; sampling a voltage of said second winding at a time preceding or equal to said beginning of said subsequent post-conduction resonance condition; and controlling subsequent energizing of said magnetic storage element in conformity with said sampled voltage.

Claim 28 recites, inter alia, an integrator having an input coupled to said second winding for providing an output representing an amount of magnetic energy storage in said power magnetic element, a comparison circuit for detecting when said output of said integrator indicates that said amount of magnetic energy storage has reached a level substantially equal to zero, a sampling circuit having a signal input coupled to said second winding and a control input coupled to an output of said comparison circuit for sampling a voltage of said second winding in

Art Unit: 2838

conformity with said integrator indicating that said amount of magnetic energy storage has reached said substantially zero level, and a switch control circuit having an output coupled to said switching circuit and having an input coupled to an output of said sampling circuit, whereby said switching circuit is controlled in conformity with said sampled voltage.

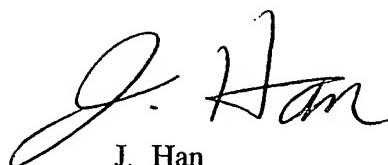

The art of record does not disclose the above limitations, nor would it be obvious to modify the art of record so as to include either of the above limitations.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Y. J. Han whose telephone number is 571-272-2078. The examiner can normally be reached on Mon-Fri 5:30am-2:00pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Michael Sherry can be reached on 571-272-2084. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
